

Prodim

World leader in complete digital templating solutions

Prodim is an international company known for its self-developed portable digital measuring tool, the Proliner. When it comes to digital templating within the marine building industry, the Proliner is unmatched in accuracy, speed, flexibility and ease of use due to its unique technology—measuring with a pen and a wire. You simply mark relevant points with the pen and the exact positions of measured points are directly translated into a digital template (DXF). Measuring with a wire does not require targets and has no reflection inaccuracies. Straight, curved and very complex shapes can be measured quickly and accurately from every position. This flexibility enables marine fabricators to expand their business since they can create digital templates of covers, decks, flooring, bimini tops, awnings, sails, hulls, railings, doors, portholes, interiors and much more using only one tool. Therefore, the Proliner gives the best return of investment to marine fabricators.

PRODUCTS: The Proliner digital templating tool, Proliner software to edit, finalize and export digital templates, the Proliner IPT (Inverted Pen Technology) for measuring hard-to-reach points, the Proliner Hookpen for measuring tubular frames, the Prodim Plotter and the Prodim Procutter.
